Key findings

- Multiple regions show strong evidence of editing.
- Showing the top 5 highest-confidence regions (highest score 100%). 34 of 205 text-bearing regions exceeded the model's threshold overall.
- Edit type predicted across the top 5 regions: 5 x copy-paste edits.
- Targeted fields: 3 x Total / payment lines and 2 x Company / header info.
- This file is an exact duplicate of one already analysed in this session.

VAT QR check

No ZATCA-format VAT QR detected on this receipt.

Approach

ResNet-18 patch classifier (128x128, stride 64) trained on FINDIT2 (Tornes et al., ICDAR 2023). Two auxiliary heads classify the modification technique and the document field affected; the binary backbone is frozen so the headline patch precision (92.25%) is preserved while adding explainability. The image-level fraud score is the top-k mean of patch probabilities over text-bearing regions only (edge density ≥ 0.02). The Saudi VAT QR check validates the ZATCA Phase-1 TLV format and cross-checks the QR's declared totals against pytesseract OCR of the printed receipt body.
